1. Start your web browser of choice and. Display the error console and clear it (we do this because many pages on the web have errors and if you have been browsing the error console will be full of warnings and errors).

2. Load the `bugs.html` file.

3. What displays on the screen? A blank white screen and the words start of document and end of document

4. What is the first error listed in the error console? _____

   bugs.html:17 Uncaught SyntaxError: Unexpected identifier
   _____

5. Correct the problem causing the first error. Even if you see other errors, leave

   them for now. What code did you change? _____

   _____ from x to * for multiplication _____

6. Clear the error console (this way you won't need to sort through leftover errors as

   well as current ones), then reload the page. What displays now? _____

   _____ bugs.html:18 Uncaught SyntaxError: Unexpected token ; _____

7. Correct the next error. What did you change? _____ added a parenthesis _____

8. Reload the page, what displays now? Start of document.
   9; Sum of 12 and 8 is = 128; Average is = 19.4; END of document. _____

9. Reload the page. Are there any more errors in the Error Console? What are they?_

   _____ bugs.html:21 Uncaught ReferenceError: oldprod is not defined _____

   _____

10. Is there anything wrong in the data that displays? If so, what? _____

_____ 12 + 8 = 20 not 128 _____

11. Reload the page. When you have everything working, insert the following error:

On the
```
<script type="text/javascript">
```
tag, remove the second quote leaving
```
<script type="text/javascript>
```

Reload the page. What happens? Why? _____

_____ the script does not execute because the " mangles what is and is not a string ___

_____

12. There should be no errors left in the Error Console. Why not? _____

_____ there are not errors I have fixed them all _____
